1. Specifications

Motor Section

Motor	: DC type, FG servomotor
Drive system	: Belt drive
Speeds	: 33-1/3 rpm, 45 rpm
Wow and flutter	: 0.08 % (DIN), 0.06 % (WRMS)
Signal-to-noise ratio	: More than 60 dB (DIN-B)

Tonearm Section

Type	: Linear tracking statically balanced low mass arm
------	--

Effective length	: 102 mm
Tracking error	: 0.3°

Cartridge Section

Model	: MD-1038L (USA, Canada only) MD-1041 (others)
Type	: Low mass type, dual magnet (USA, Canada only), induced magnet (others)
Frequency response	: 20 Hz — 20,000 Hz
Output	: 2.4 mV (1,000 Hz)
Channel separation	: 20 dB (1,000 Hz) (Test record TRS-1)

Load resistance	: 47 kΩ
Stylus tip	: 0.6 mil diamond
Stylus	: DT-38 (USA, Canada only), DT-41 (others)
Optimum tracking force	: 2.0 g (USA, Canada only), 2.5 g (others)

General

Power source	: See below.
Power consumption	: See below.
Dimensions	: 8.7 cm (H) x 34 (or 34.4) cm (W) x 35 cm (D) (Since the dimensions are only the design figures, additional space will be required when installing the unit in a rack, etc.)
Weight	: 4.5 kg (10.0 lbs) (without corrugated cardboard case)
Accessory	: EP adaptor 1

Design and specifications subject to change without notice.

Power specifications

Countries	Line Voltage & Frequency	Power Consumption
U.S.A., CANADA	AC 120 V~, 60 Hz	12 watts
EUROPEAN CONTINENT	AC 220 V~, 50 Hz	12 watts
U.K., AUSTRALIA	AC 240 V~, 50 Hz	12 watts
U.S. MILITARY MARKET	AC 110 ~ 120/220 ~ 240 V~ Selectable, 50/60 Hz	12 watts
OTHER AREAS	AC 110 ~ 120/220 ~ 240 V~ Selectable, 50/60 Hz	12 watts

2. Names of Controls and Their Functions

Fig. 1

1. SPEED SELECT button

Select the turntable speed as required.

2. Lock buttons

Press these buttons to open the cover.

Note:

If the cover is opened during playback of a record, playback will stop and the tonearm will automatically return to the rest position.

3. READY switch

ON (☐): Press to IN position to turn on the power. The AUTO indicator will light.

OFF (■): Press again to set to OUT position to switch the power off.

Note:

- When the cover is opened, playback will not start even if the READY button is set to ON.
- Even when the READY switch is off, this turntable consumes a small amount of electricity. This is to return the tonearm to the rest position when the READY switch is set to OFF or the cover is opened during playback. If you are not going to use the turntable for a long time, disconnect the power cord from the wall socket.

4. UP/DOWN button

If this button is pressed during playback, the tonearm is raised and the MANUAL indicator will light to show that manual playback is being employed.

When manual playback is used, press this button to lower the tonearm after moving the tonearm using the "◀" (START) and "▶" (STOP) buttons.

At the same time that the tonearm is lowered, the AUTO indicator lights to show that automatic playback is being employed. If this button is pressed when the tonearm is raised, the tonearm will be lowered; if it is pressed when the tonearm is lowered, the tonearm will be raised. It can be used to raise the tonearm to pause during the manual or automatic playback of a record.

5. START button (◀)

Press this button to start automatic playback. For manual playback, hold this button pressed. When holding this button pressed, the tonearm will start to move and the indicator will change from AUTO to MANUAL; release this button at the desired position. The tonearm will stop at that position; now press the UP/DOWN button to start playback.

If this button is pressed during playback, the tonearm will move to the left automatically (←) and return to the rest position; if the UP/DOWN button is pressed while the tonearm is moving, playback will start at that position. This allows it to be used for the playback of any tune (music scanning).

6. STOP button (▶)

If this button is pressed during playback, the tonearm will move to the right (→) automatically and when it reaches the rest position, the tonearm indicator will go out and the turntable will stop.

If the UP/DOWN button is pressed while the tonearm is moving, playback will start again at that position, so this can be used for music scanning. When the tonearm stops in the up position (manual playback) the tonearm will move to the right (→) while this button is pressed.

7. SIZE SELECT button

Used for automatic selection of the position where the tonearm will descend and where playback will end according to the record.

8. MANUAL, AUTO indicator

Indicates manual playback when the MANUAL indicator lights, and automatic playback when the AUTO indicator lights.

9. EP adaptor

Place the adaptor on the center spindle when playing an EP with a large center hole.

10. Tonearm indicator

This indicator lights when the START button is pressed and during the playback showing the position of the stylus.

11. Clamp

Move this clamp to the right (↗) to release the tonearm lock. If the tonearm is locked, playback is impossible. If the clamp is moved to the left (↖), the tonearm will be locked in the up position. Used in this position when transporting the turntable.

3. Service Precautions

3-(1) For safety

1. When replacing the parts marked with \triangle , be sure to use the designated parts to ensure safety.
2. A solderless connector is used in connection between the power cord and the primary lead wires of the power transformer.
When replacing the power transformer, when the connector must be replaced unavoidably, be sure to confirm that the solderless connection is properly made.
3. When replacing the power cord, confirm that the new power cord is not disconnected even when pulled in every direction.

3-(2) In disassembly

1. When repairing or checking the tonearm for desirable action, remove the mechanism cover.
In this case, refer to "Troubleshooting" on pages 16-20.
2. When replacing or removing the tonearm, the motor or any other mechanism component, be sure to check and adjust the lead-in position, the tracking error sensitivity, etc.
3. Do not apply a lubricant to the engaging section of the drive and worm gears.
4. Do not apply a lubricant to the arm rail on which the tonearm moves. In addition, since a lubricant (Shin'etsu silicone G-331) is used in the pickup damper, be careful not to attach it to the arm rail when replacing.
5. When remounting the mechanism cover, check each wire for connection and at the same time pay special attention to the wire arrangement to protect the tonearm from abnormal action. In addition, set the length of each arm signal wire up to the clamping (taping) position of the sensor board at 100 ± 5 mm.
6. When remounting the surface cover upon completion of servicing, confirm that the cover lock mechanism is positively working with the cover closed.

3-(3) Operation check after servicing

1. When only turning ON the POWER switch with the surface cover closed, the platter and tonearm should both not move.
2. Even when pressing the STOP (S104) or UP/DOWN (S105) switch from the situation of item 1, the mechanism should not operate.
3. With the SIZE select switch (S102) set to "30", when pressing the START switch (S103) from the situation of item 1, the tonearm should move inwards, the LED (D601) at the cartridge's tip light and the turntable rotate. In addition, the tonearm should pause for about 2 sec before being led in.
4. While pressing the START switch with the SIZE select switch set to "17" from the situation of item 3, when the tonearm passes through the "17" lead-in position, the green LED (D108) should go out and the red LED (D109) light.
When stopping pressing the START switch, the tonearm should stop action.
5. When pressing the UP/DOWN switch from the situation of item 4, the tonearm should lower down, the red LED go out and green LED light.
6. Upon play under the situation of item 5, the tonearm should follow the groove normally.
7. When opening the surface cover or turning OFF the POWER switch from the situation of item 6, the tonearm should return to its rest and the turntable stop rotation.

4. Main Parts Location

Fig. 2

Fig. 3

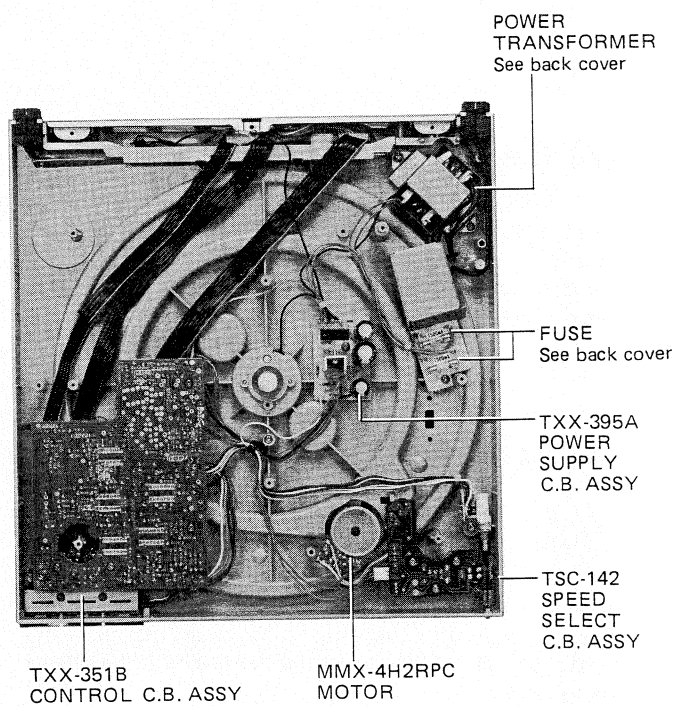

Fig. 4

5. Removal Procedures

5-(1) Removal of surface cover (Fig. 5)

1. Remove the rear cover.
2. Remove the respective securing screws ① - ④ of the right and left hinges.

Note:

Since these hinges use a strong spring, unscrew each group of screws depressing the hinge.

3. Remove the connection wires from sockets ⑤ - ⑧.
4. Remove the surface cover with screwdriver as pushing it out backwards (to the rear side).

Note:

After remounting the surface cover, confirm that the cover lock mechanism is positively working with the cover closed.

Fig. 5

5-(2) Removal of mechanism cover (Fig. 6)

1. Move the tonearm to its start position.
2. Remove the securing black screws ① - ⑨ of the mechanism cover.

Fig. 6

5-(3) Removal of mechanism base ass'y (Fig. 7)

1. Remove the securing screws ① - ④ of the right and left hinges.
2. Remove securing screws ⑤ - ⑦, then take out the mechanism cover.

5-(4) Removal of tonearm ass'y (Fig. 7)

1. Remove carrier rope ⑧ from roller ⑨.
2. Remove shaft bracket ⑩, then take the tonearm off the shaft (arm rail).

Note:

When remounting tonearm ass'y, confirm that the shutter and guide pins are at right angles with the side of the tonearm.

Fig. 7

5-(5) Replacement of cartridge (Fig. 8)

1. Remove the stylus.
2. Remove lead wires ①.
3. Remove the securing screw ② of the headshell.
4. Remove screw ③, then replace the cartridge.

Note:

While paying attention to the lead wires for disconnection after replacement, securely tighten screw ② to secure the headshell.

5-(6) Replacement of PLAY indicator (LED) (Fig. 8)

1. Remove the headshell cover by pushing it up in the direction of an arrow, then replace the indicator.

Notes:

1. Do not apply stress to the base of the LED.
2. Use a soldering iron of less than 20 W.
3. Soldering time must be less than 2 sec.
4. Secure the headshell cover with the screw lock.

Fig. 8

5-(7) Stringing of sensor wire (Fig. 9)

1. When replacing the carrier base, positively string the sensor wire as shown.

Note:

Since this sensor wire acts as the output of +B, unplug the power cord when replacing.

Fig. 9

5-(8) Replacement of spindle shaft (Fig. 10)

1. Remove securing screws ①, then take it out.

Note:

Screw ② is used to secure the plate. When removing this plate mistakenly, confirm that the lubricant (Anderole 732) does not leak.

Part Number	Description
EBS0008-001	Anderole 732

Fig. 10

6. Alignment Procedures

6-(1) Motor RPM adjustment (Fig. 11)

Remove the turntable covering, then adjust it by a VR shown. Turning clockwise permits increased RPM, while turning counterclockwise permits decreased RPM.

45rpm : VR401

33rpm : VR402

Fig. 11

6-(2) Lead-in adjustment (Fig. 12)

Adjust it with a VR shown. Turning clockwise causes the position to shift outwards, while turning counterclockwise causes it to shift inwards.

Fig. 12

6-(3) Tonearm following sensitivity adjustment (Fig. 13)

With the tonearm at the UP position, adjust it with VR201 shown. The output voltage should be 3.5 ± 0.2 V between (1) and (2) of test point (P203). (Adjust the output to this voltage at a lapse of more than 3 minutes after power ON.)

Fig. 13

7. Carrier Rope Stringing Procedure

When setting the tonearm ass'y to the right end, string the carrier rope so that the spring is located above screw A shown in Fig. 14.

Length of rope: 529 mm (between knots)

Fig. 14

8. Connection Diagram

Fig. 15

12. Troubleshooting

12-(1) When tonearm action is abnormal

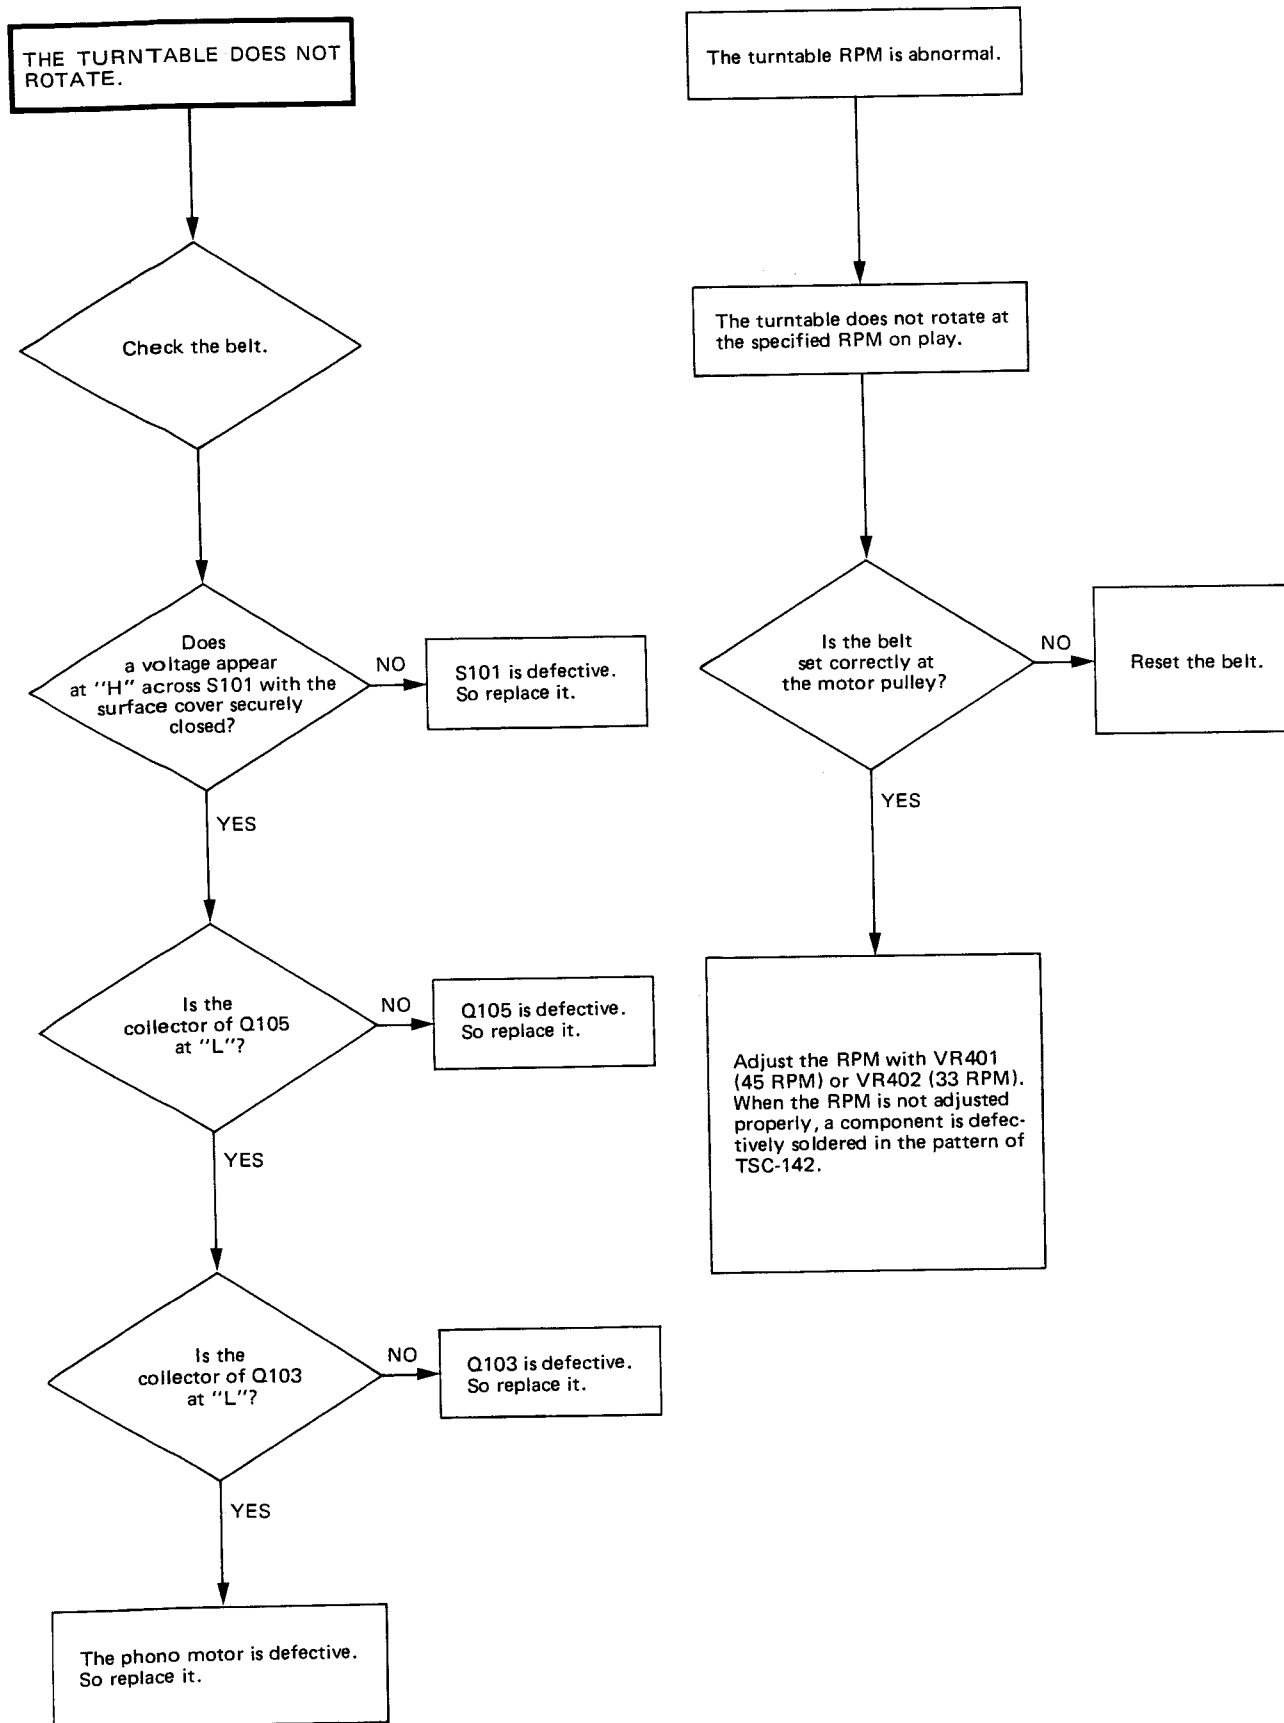

12-(2) When turntable operation is abnormal

13. Power Cord Connections in Different Areas

Fig. 29

13-(1) How to handle the solderless connector

In this turntable, a solderless connector is used to connect the power cord with the primary lead wire of the power transformer.

When it is unavoidable to replace this connector for replacement of the power transformer, or the like, positively perform the replacement in accordance with the following procedure to avoid dangers.

- **Connector part number**

E03830-001

- **Tools**

Tool for installing solderless connectors.

Do not use those (small cutting pliers, etc.) other than regular tools.

Example: VACO No. 1963 (Courtesy Vaco Products Co.)

Fig. 30

- **Replacement**

1. Cut both the power cord and the primary lead wire at near the edge of the connector to be replaced.

Note: Do not re-use the used connector.

Fig. 31

Fig. 32

2. Peel off the coverings so that the respective conductor tops appear by about 15 mm as shown in the Fig. 32.

Note: In the case of stranded wires, test each wire.

3. Adjust the tips of the power cord and the primary lead wire with each other, then securely insert them into the connector as shown in the Fig. 33.

Fig. 33

Fig. 34

4. Secure the nearly equal central part of the metal sleeve with the second concave of the tool for solderless securing as shown in the Fig. 34.

Note: Perform a complete securing.

5. After solderless securing, check the following as shown in the Fig. 35.

Note: Protect connector with isolation tape or vinyl tube for safety. Furthermore, clamp it for out of touch with metal part.

These shall not be easy to draw out.
The clamped marks shall locate at the nearly equal central part of the metal sleeve.

More than 4 mm

Fig. 35

Chapter 6. Circuit Diagram and P.C.Board Connection Diagram

6-1 Schematic diagram

L-E600 is configured as shown in Figs 17 and 18. For the voltage value and adjustment of each section, refer to the Service Manual No. 2586 for linear tracking full-auto turntable L-E600. It should be here noted that the symbol Nos in Fig. 17 are different from those in the service note for practical description.

Chapter 1. Features

1-1 T.L.T. system employed

In the TLT (Top side Linear Tracking) system, since the linear tracking tonearm and the sweep drive mechanism are located at the upper side of the turntable, the horizontal space is expanded that much. (Fig. 1)

1-2 Ease in mounting and demounting

Since the tonearm is incorporated in the cover of the upper side owing to the TLT system, it is unnecessary to pay attention to the pickup as in a conventional turntable when mounting or demounting the record.

1-3 Logic control by three buttons

As the tonearm is logic controlled by the three operation buttons () in the front section, auto play is possible by simply pressing the button.

1-4 Operation can be monitored at a glance

1) PLAY monitor:

When the START button is pressed, as the PLAY indicator LED (red) at the cartridge's tip lights, it is easier to check the position of the tonearm.

2) AUTO/MANUAL monitor:

The auto and manual modes can be freely switched to each other by operating operation buttons. According to the selected mode, a red or green LED lights to indicate the mode.

Fig. 1

1-5 No-contact horizontal tracking error detection with photo-sensor

The horizontal tracking error is detected so that the tonearm follows the groove on play to move parallel. Concretely, very small deviation angle of

the tonearm is detected by the photo-sensor. Thereby, the arm carrier is slided by the high-speed servo control, thus permitting linear tracking.

Fig. 2

1-6 Auto safety reject mechanism employed

During play, when opening the cover or turning off the POWER switch, the tonearm is automatically rejected to its rest position in either case. The

turntable is designed to stop rotation especially when the cover is opened.

1-7 Auto lift-up mechanism employed

During play, even when the power cord is mistakenly unplugged or a power failure occurs, the tonearm is necessarily lifted up. Thus, the stylus

and record are protected from damage. This is also true of when the timer play is at OFF.

1-8 IM cartridge and low-mass aluminum tonearm employed

Utilizing the excellent response at high frequencies. As the mass of the cantilever is lowered, the response at high frequencies is extended and the distortion rate is decreased. Thus, the sound can be reproduced more clearly and straightly.

Concerning the tonearm, its horizontal tracking effective length is shortened to 102 mm. In addition, its rigidity is heightened and its mass is lowered by employment of aluminum frame.

1-9 FG servo motor and alminum diecasting platter

Through employment of newly developed thin type FG servo (frequency speed control) motor

and aluminum diecasting platter, the rotating accuracy is high despite of the belt drive.

Chapter 2. Operation Modes

NOTE : The turntable speed (33/45 RPM) and record size (30/17 cm) selectors are manual switches.

		
UP/DOWN	START/FWD	STOP/REW

2-1 Auto play

When pressed during play, arm is lowered down or lifted up according to its situation.

When pressed during auto FWD or REV, arm is lowered down. (With 17 cm record, be careful not to lower down outside of disc.)

When pressed to start, arm is led in and led out after play according to record size.

When pressed during play, arm is lifted up and forwarded.

In the latter case, when arm is not lowered down, it is led out at lead-out position.

When pressed during play, arm is led out at its existing position.

2-2 Manual play (A)

When pressed during play, arm is lifted up at its existing position to enter manual mode.

When pressed again, arm is lowered down and play is performed in auto mode.

While being pressed while arm is being lifted up, arm is forwarded.

During pressing, arm is not led out.

While being pressed while arm is being lifted up, arm is reversed.

During pressing, arm returns to its rest to enter auto mode.

2-3 Manual play (B)

When pressed until arm passes through predetermined lead-in position, turntable enters manual mode.

2-4 Cancel of manual mode

When the tonearm is lifted up, the turntable enters manual mode. When it is lowered down, the manual mode is canceled.

NOTE: Special cases of canceling the manual mode.

- 1) Turning the power OFF once:
When canceling the manual mode without the tonearm lowered down.
- 2) Opening the cover once:
Not recommended

2-5 Precautions on operation

- 1) Do not start the turntable without a record mounted.
- 2) Correctly set the SIZE select switch.
- 3) Release the arm lock lever. (Pull it to your side, referring to Fig. 2.)

2-6 Operation check (Summary)

Check the following operational items in or after servicing.

- 1) When only turning ON the POWER switch with the cover closed, the turntable and tonearm should both not move.
- 2) Even when pressing the STOP (S104) or UP/DOWN (S105) switch from the situation of item 1), the mechanism should not operate.
- 3) With the SIZE select switch (S102) set to "30", when pressing the START switch (S103) from the situation of item 1), the tonearm should move inwards, the LED (D601) at the cartridge's tip light and the turntable rotate. In addition, the tonearm should pause for about 2 sec before being led in.
- 4) While pressing the START switch with the SIZE select switch set to "17" from the situation of item 3), when the tonearm passes through the "17" lead-in position, the green LED (D108) should go out and the red LED (D109) light.

When stopping pressing the START switch, the tonearm should stop action.

- 5) When pressing the UP/DOWN switch from the situation of item 4), the tonearm should lower down, the red LED go out and green LED light.
- 6) Upon play under the situation of item 5), the tonearm should follow the groove normally.
- 7) When opening the cover or turning OFF the POWER switch from the situation of item 6), the tonearm should return to its rest and the turntable stop rotation.

NOTE: On method of test with cover opened
As the cover switch (S101) is connected to the cover lock mechanism at the right in front of the motor board, push in the lock section (oval black mold piece) about 4~5 mm (not more than 5 mm). In this way, it is possible to perform the trial test of items 1) to 7).

Chapter 3. Mechanism

3-1 Tonearm mechanism

The tonearm is lifted up or lowered down by operating the solenoid plunger by the arm UP/DOWN signal of the control circuit. When the solenoid is activated, the rod is rotated by the

angle conversion arm in a certain direction, thus the tonearm is lowered down through the elevation arm. Differently, when the solenoid is released from activation, the tonearm is lifted up.

3-2 Tonearm movement control

Secondly, the rotating direction of the carry motor is controlled by the FWD/REV signal. Thus, the tonearm is forwarded or reversed along the rod together with the carrier on which the tonearm is mounted. In this case, only when the arm UP/DOWN sensor detects that the tonearm is being lifted up, the tonearm is forwarded or reversed by an operation button.

Thirdly, the position of the tonearm is detected by the brush mounted at the rear part of the carrier

and the position sensor with the electrodes mounted at the lead-in and lead-out positions. Thus, the tonearm is led in or out as predetermined.

Lastly, the arm deviation angle is detected by the tracking error sensor and the control circuit functions to forward the tonearm sequentially little by little by the carry motor. Thus, the tonearm follows the groove correctly on play.

Fig. 4 shows the block diagram of the control circuit. Each circuit block performs as follows:

Fig. 3

Chapter 4. Block Diagram and Introduction to Circuits

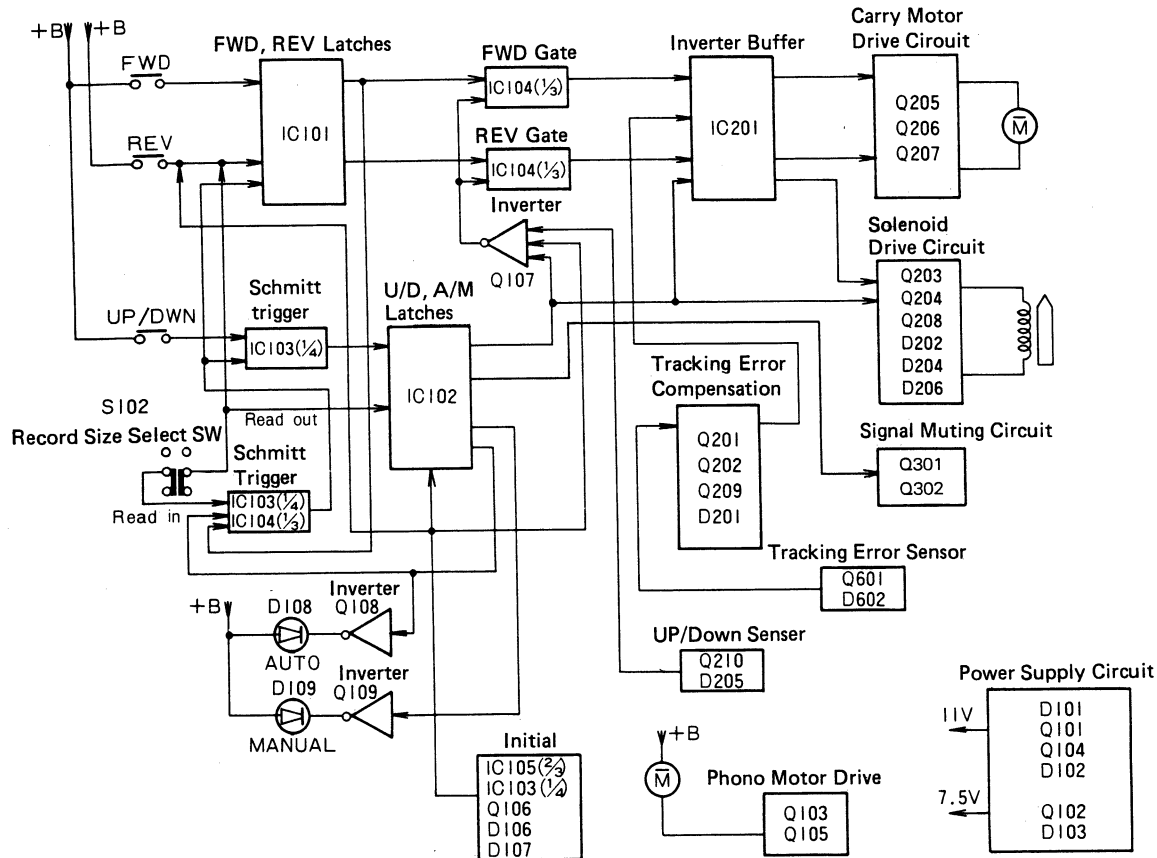

Fig. 4

4-1 Carry motor drive circuit

This circuit controls the rotating direction of the carry motor by signal, thus permitting the FWD

and REV operation of the tonearm.

4-2 Solenoid drive circuit

This circuit functions to lift up and lower down the tonearm by signal. When the solenoid is acti-

vated, the tonearm is lowered down to enter the play mode.

4-3 Inverter buffer

This circuit inverts signals FWD OUT, REV OUT, PLAY, DOWN OUT, and similar others to actuate

the drives in the output side of the control circuit.

4-4 Tracking error sensor and compensator

The sensor detects the tracking error of the tonearm and the compensator generates signal PLAY OUT to compensate this error. Thus, the tonearm

is forwarded by signal PLAY sequentially little by little so that it is controlled to trace the groove correctly.

4-5 FWD and REV latches

These latches keep the operation states of the START/FWD and STOP/REV switches. These latches are controlled so that signal FWD or REV

is emitted for lead-in or lead-out operation by the signal from another block when in the auto mode.

4-6 Up/Down and auto manual latches

The UP/DOWN latch, when the UP/DOWN button is pressed, holds the UP or DOWN mode of the tonearm to emit an output. The AUTO/MANUAL latch holds the auto or manual mode according to

the operation mode to emit an output. These latches are controlled so that the lead-in or lead-out operation is performed by the signal from another block.

4-7 Size selector switch and lead-in/lead-out

The output of the position sensor is correctly used according to the selected size to control each block so that the tonearm is led in and out properly.

The lead-in gate indicates the lead-in operation to each block, when signal LEAD IN is detected during forwarding the tonearm in the auto mode.

4-8 Tonearm up/down sensor

This circuit detects the UP or DOWN action of the tonearm.

4-9 FWD and REV gates, and Q107

The FWD and REV gates emit the FWD and REV signals as FWD OUT and REV OUT, respectively. When signal DOWN OUT is emitted or when the

initial reset is performed or until the tonearm is completely lifted up, FWD OUT and REV OUT are not emitted by Q107.

4-10 Initial reset and play circuit

When the power is turned ON or OFF, or when the cover is opened, this circuit indicates the lead-out operation unless the tonearm is at its rest position

and inhibits other than the start operation if it is at the rest position.

4-11 Signal Muting Circuit

The signal muting circuit, Q301/Q302 operation is performed by the DOWN OUT signal of the UP/DOWN latch.

When the tonearm is lowered down (lifted up), the signal muting circuit, Q301/Q302 is turned off (turned on).

5-2 Carry motor drive circuit

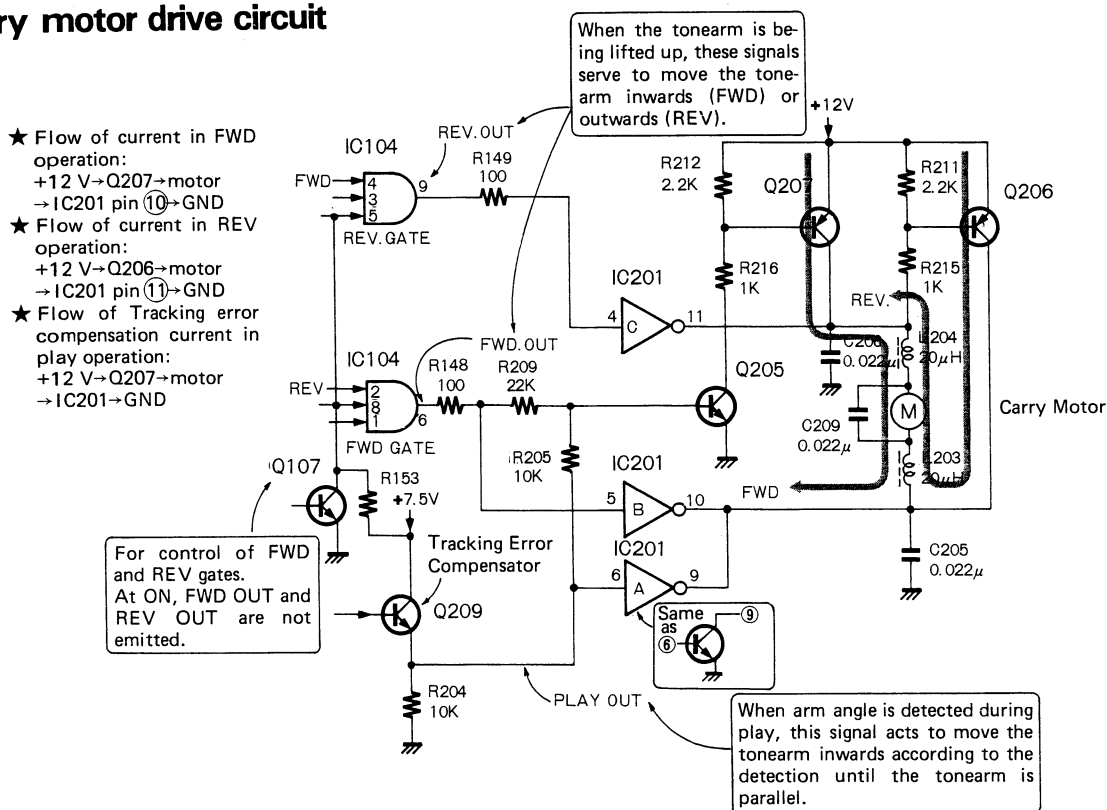

Fig. 7

This circuit is as shown in Fig. 7.

The carry motor acts to move the tonearm by signal REV OUT, FWD OUT or PLAY OUT. In each of the FWD, REV and play operations, the respective states of each section are as follows:

IC201MPA53C is a Darlington transistor array IC.

Each input is entered from the base terminal and each output is emitted from the collector terminal. For the flow of the operating current in each mode, refer to Fig. 7.

Q107 is used for gate control. At ON, FWD OUT and REV OUT are not emitted.

MODE	REV	FWD	PLAY	UP
REV OUT (IC104 ⑨)	H	L	L	L
FWD OUT (IC104 ⑥)	L	H	L	L
PLAY OUT (Q209E)	L	L	H	L
IC201 ⑪	L	H	H	H
IC201 ⑩	H	L	H	H
IC201 ⑨	H	L	H	H
Q206	ON	OFF	OFF	OFF
Q205	OFF	ON	ON	OFF
Q207	OFF	ON	ON	OFF
CARRY MOTOR	REV ROTATION	FWD ROTATION	FWD ROTATION	STOP

5-3 Solenoid drive circuit

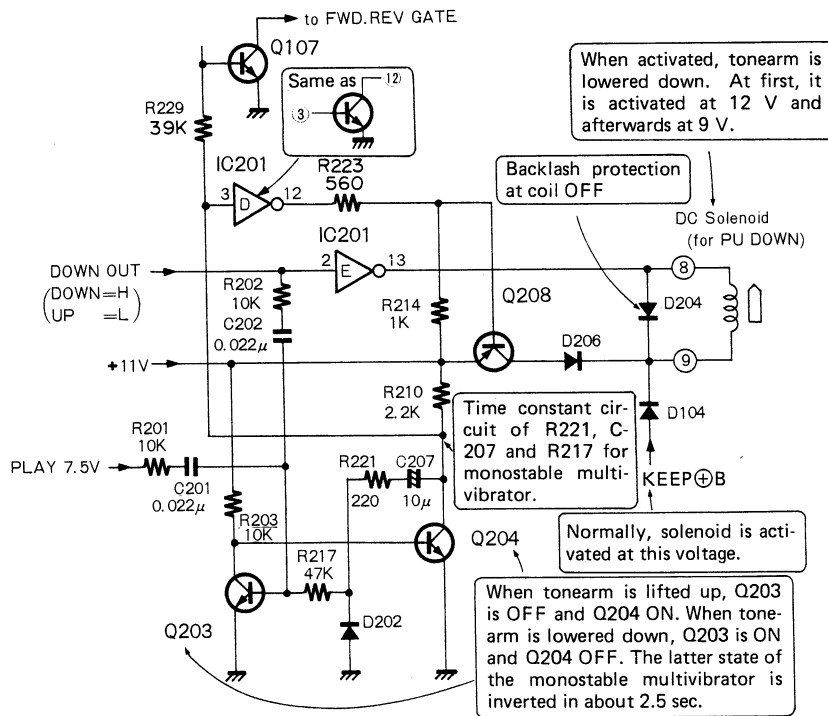

Fig. 8 Solenoid Drive Circuit

This circuit is as shown in Fig. 8.

This circuit is controlled by the arm UP/DOWN signal to activate the solenoid by which the tonearm is lifted up or lowered down. Q203 and Q204 from a monostable multivibrator. Normally (when the tonearm is lifted up), Q203 turns OFF and Q204 ON. Thus, pin 12 of IC201 becomes "H" to turn Q208 OFF. When the tonearm is lifted up, since signal DOWN OUT is "L", pin 13 of IC201 is "H" (the transistor of pin 13 is OFF). Thus, the solenoid is not activated and the tonearm is at the UP position.

Next, when the tonearm is lowered down, since signal DOWN OUT becomes "H", pin 13 of IC201 is "L". Thus, when Q203 is turned ON and Q204 OFF at the leading edge of signal DOWN OUT through R202 and C202, since the collector of Q204 is "H", pin 12 of IC201 becomes "L". +12 V thereby serves to activate the solenoid through the route of Q208→D206→solenoid→IC201 pin 13. This activation continues for about 2.5 sec by the time constant circuit of C207, R221 and R217. Subsequently, since the monostable multivibrator of Q203 and Q204 returns to the stable state in which Q203 is OFF and Q204 ON, the

collector of Q204 is "L" and pin 12 of IC201 is "H". Thus, Q208 turns OFF and the solenoid is held ON by KEEP ⊕ B voltage.

Finally, when the tonearm is released from its rest by pressing the START switch, the trigger of R201 and C201 functions to actuate the monostable multivibrator of Q203 and Q204 by PLAY 7.5 V with the REST switch at PLAY. Thereby, this trigger acts to temporarily stop the action of the tonearm (at the outermost position of the 30 cm LP record).

Since the distance between the rest and "30 cm" lead-in positions is short, when the START switch is pressed for an excessively long time, the mode changes from auto to manual (play (B)) when the tonearm passes through the lead-in position. To avoid this problem, the above temporary stoppage is performed, thus assuring the lead-in operation of the tonearm.

During the period of the stoppage, since signal DOWN OUT resultant from detecting the lead-in position is not emitted, the solenoid is not activated. Accordingly, the tonearm is not lowered down.

5-4 Tracking error sensor and compensator

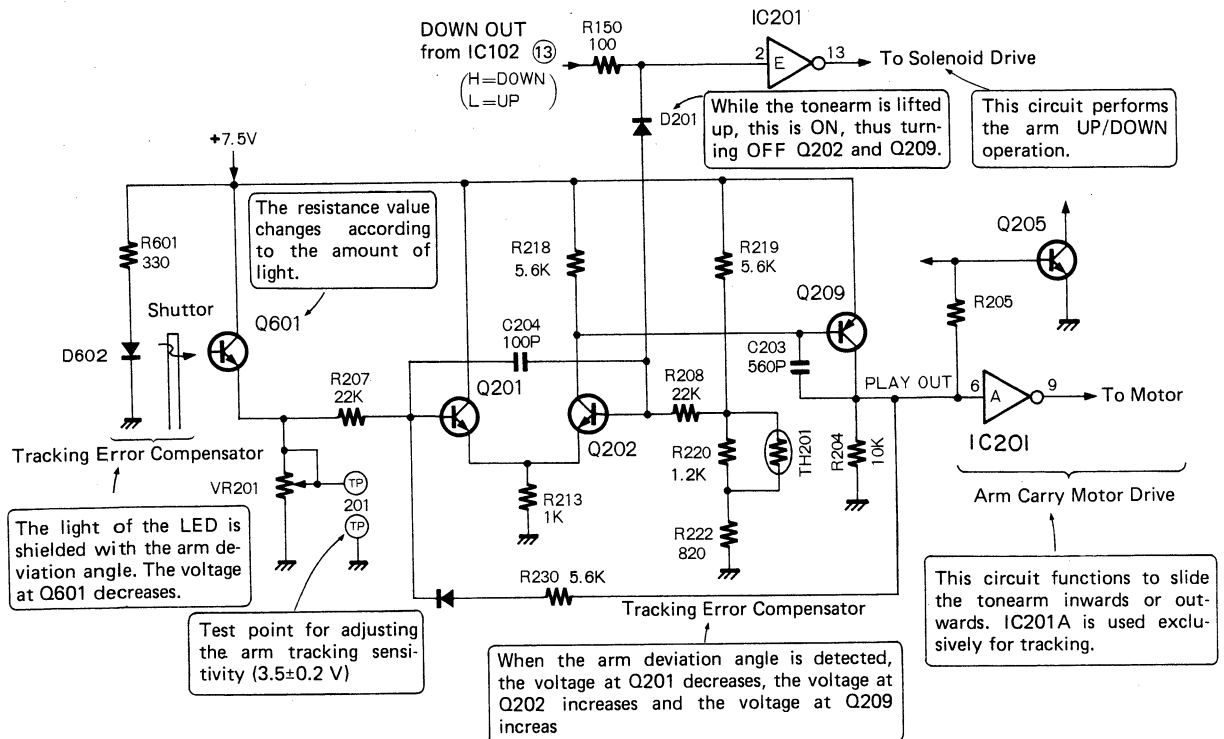

Fig. 9

This circuit of the sensor and compensator is as shown in Fig. 9.

This circuit provides the linear tracking action during play. It detects the arm deviation angle to slide the tonearm according to the detection.

The horizontal tracking error of the tonearm is detected by the tracking error sensor (consisting of an LED and a phototransistor) mounted on the carrier and the shutter placed at the tonearm. As shown in Fig. 10. This detection makes use of the fact that the emitter voltage of Q601 (phototransistor) varies when the shutter shields the light of LED D602. The shutter controls the passing amount of the light according to the amount of the tracking error. Thus, the emitter voltage of Q601 decreases, the voltage at Q201 decreases, the voltage at Q202 increases, the voltage at Q209 increases and the voltage at Q205 increases. When pin 9 of IC201 thereby becomes "H", the carry motor performs the FWD rotation to slide the tonearm (analog control).

When the tonearm is lifted up (signal DOWN OUT at "L"), D201 is used to prevent the tonearm from sliding at Q202 OFF and Q209 OFF even when tracking error occurs. The base voltage of Q202 is

the bias voltage which determines the operating point of the tracking error compensator which includes a differential circuit of Q201 and Q202. This circuit is subject to temperature compensation by TH201. VR201 is used for adjusting the tone-arm tracking sensitivity and its level determines the deviation angle at which the tracking error is compensated.

Fig. 10

5-5 Lead-In and lead-out sensor and circuit

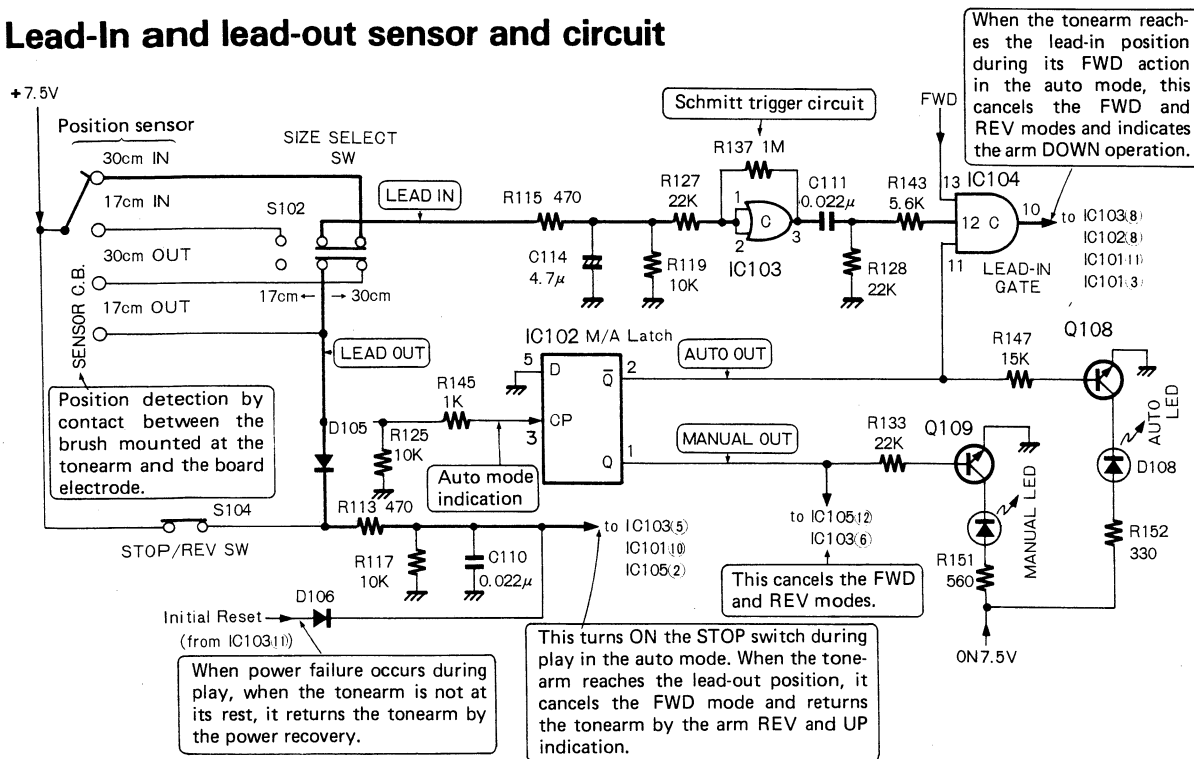

Fig. 11

Fig. 12

The position sensor shown in Fig. 12 detects the predetermined positions in combination with the wire sensor (brush) located at the rear part of the carrier and the electrodes fixed at the lead-in and lead-out positions (for 30 cm and 17 cm records) as shown in Fig. 11.

At power ON, the tonearm enters the auto mode. When the START switch is pressed, the tonearm

moves in the FWD mode. Thereupon, when the SIZE select switch is set to "30", the position sensor turns ON with "30 cm IN" and enters as signal LEAD-IN the "H" pulse into pin 12 of lead-in gate IC104 which is timed by Schmitt trigger IC103C. At this time, since signal FWD is "H" (FWD mode) and signal AUTO OUT is also "H" (auto mode), signal LEAD-IN GATE OUT (pin 10 of IC104) becomes "H", thus the FWD and REV modes are canceled (the stoppage of the tonearm motion) and indicates the arm DOWN operation so that the play starts at the "30 cm" lead-in position.

Next, signal LEAD-OUT at "H" from the position sensor becomes the lead-out (return) indication signal through D105 and R117 which in turn indicates the arm UP and REV operation to the respective circuits. At this time, the MANUAL/AUTO (M/A) latch is set to the auto mode by signal LEAD-OUT.

In addition, when the stop operation is indicated by the STOP/REV switch or power failure occurs with the tonearm not placed at its rest (the play mode), the lead-out operation is also performed by the initial reset indication for power recovery.

5-6 Initial reset and play circuit

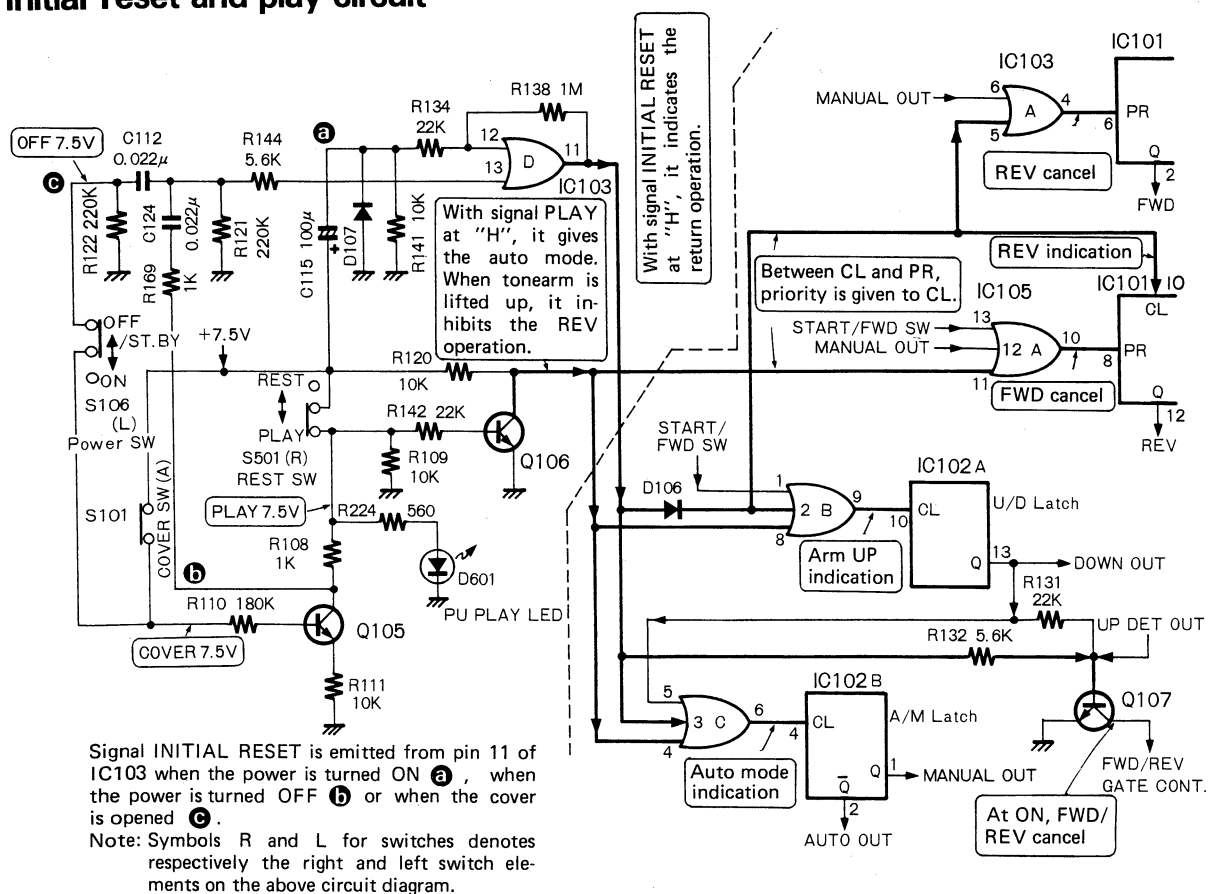

Fig. 13

This circuit is as shown at the right side of the broken lines in Fig. 13. This circuit performs the initial reset at power ON/OFF. It emits two outputs; signal INITIAL RESET from pin 11 of IC 103 and signal PLAY from the collector of Q106. At power ON, when +7.5 V makes pin 12 of IC-103 into "H" and also pin 11 of IC103 (signal INITIAL RESET) into "H" by the time constant of C115 and R141, the circuit gives the auto mode, the arm UP and REV indications, and cancels the FWD mode, thus permitting the lead-out operation. At this time, when the tonearm is at its rest, Q106 turns OFF and the circuit inhibits the REV operation by the auto mode and arm UP indications with signal PLAY at "H".

At power OFF during play, since the POWER switch is turned OFF to enter the standby mode, the lead-out operation is performed with signal INITIAL RESET at "H" through +7.5 V→C112→R144→pin 13 of IC103.

When the cover is opened during play, since the cover switch is turned OFF and Q105 OFF, PLAY 7.5 V makes pin 11 of IC103 into "H" by an "H" pulse through R108→R169→C124, thus permitting the lead-out operation.

When the initial reset operation is performed at power ON, Q107 is turned ON with signal INITIAL RESET at "H", via R132 at the start of the lead-out operation esp. by the time constant of C115 and R141. Thereby, signal REV OUT is not emitted from the REV gate during this time only.

5-7 Mode latch circuit and up/down sensor

First, we describe the operation of the D-type flip-flop of IC101 and IC102 for latch.

Each IC is CMOS TC4013BP which is composed of the D-type flip-flop with two independent circuits as shown in Fig. 14. The level of the input applied to the data (D) input is transmitted to the Q and \bar{Q} outputs at the rise time of the clock pulse (CP).

When the clear (CL) input is made "H", the Q output becomes "L" irrespective of any other

input. When the preset (PR) input is made "H" with the clear input at "L", the Q output becomes "H" independent of the clock pulse and data inputs.

When the clear and preset inputs are "H", the clear input is given priority, thus the Q output becomes "L" and the \bar{Q} output "H".

The mode latch circuit is as shown in Fig. 15, which operates as described in the timing chart of Fig. 16.

Fig. 14

Mode Latch Circuit

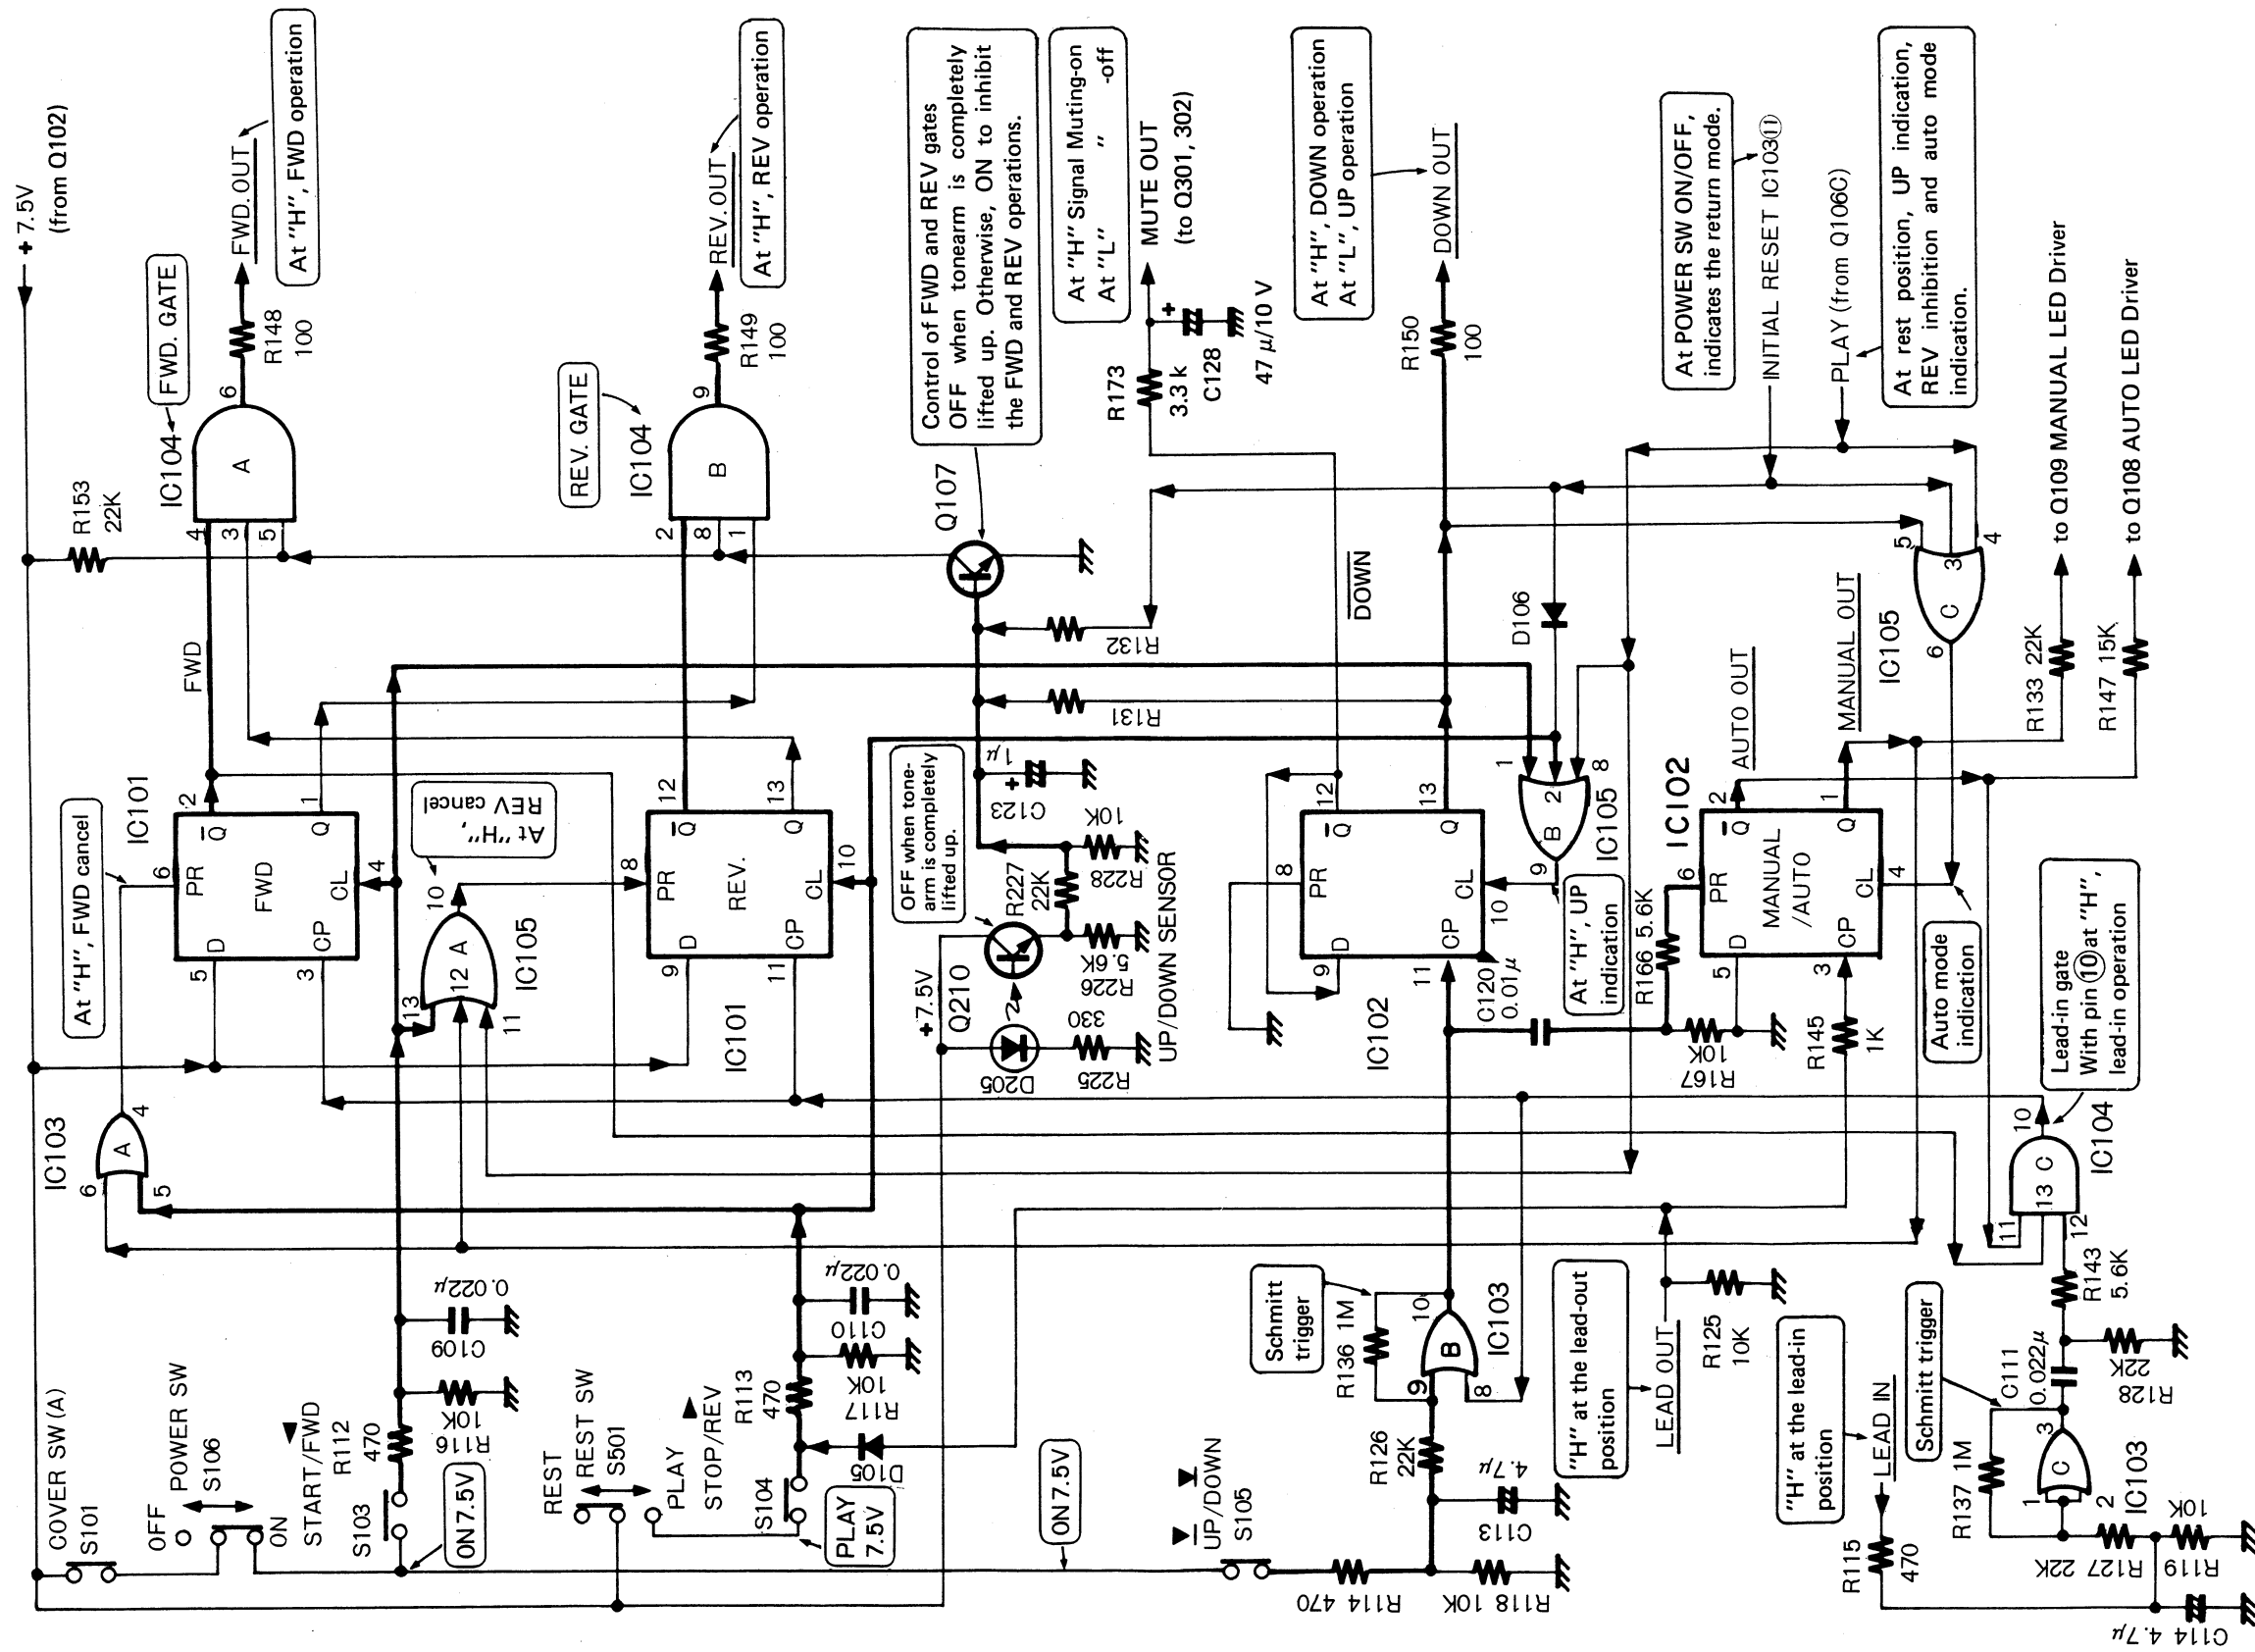

Fig. 15 Mode latch Circuit

Timing Chart

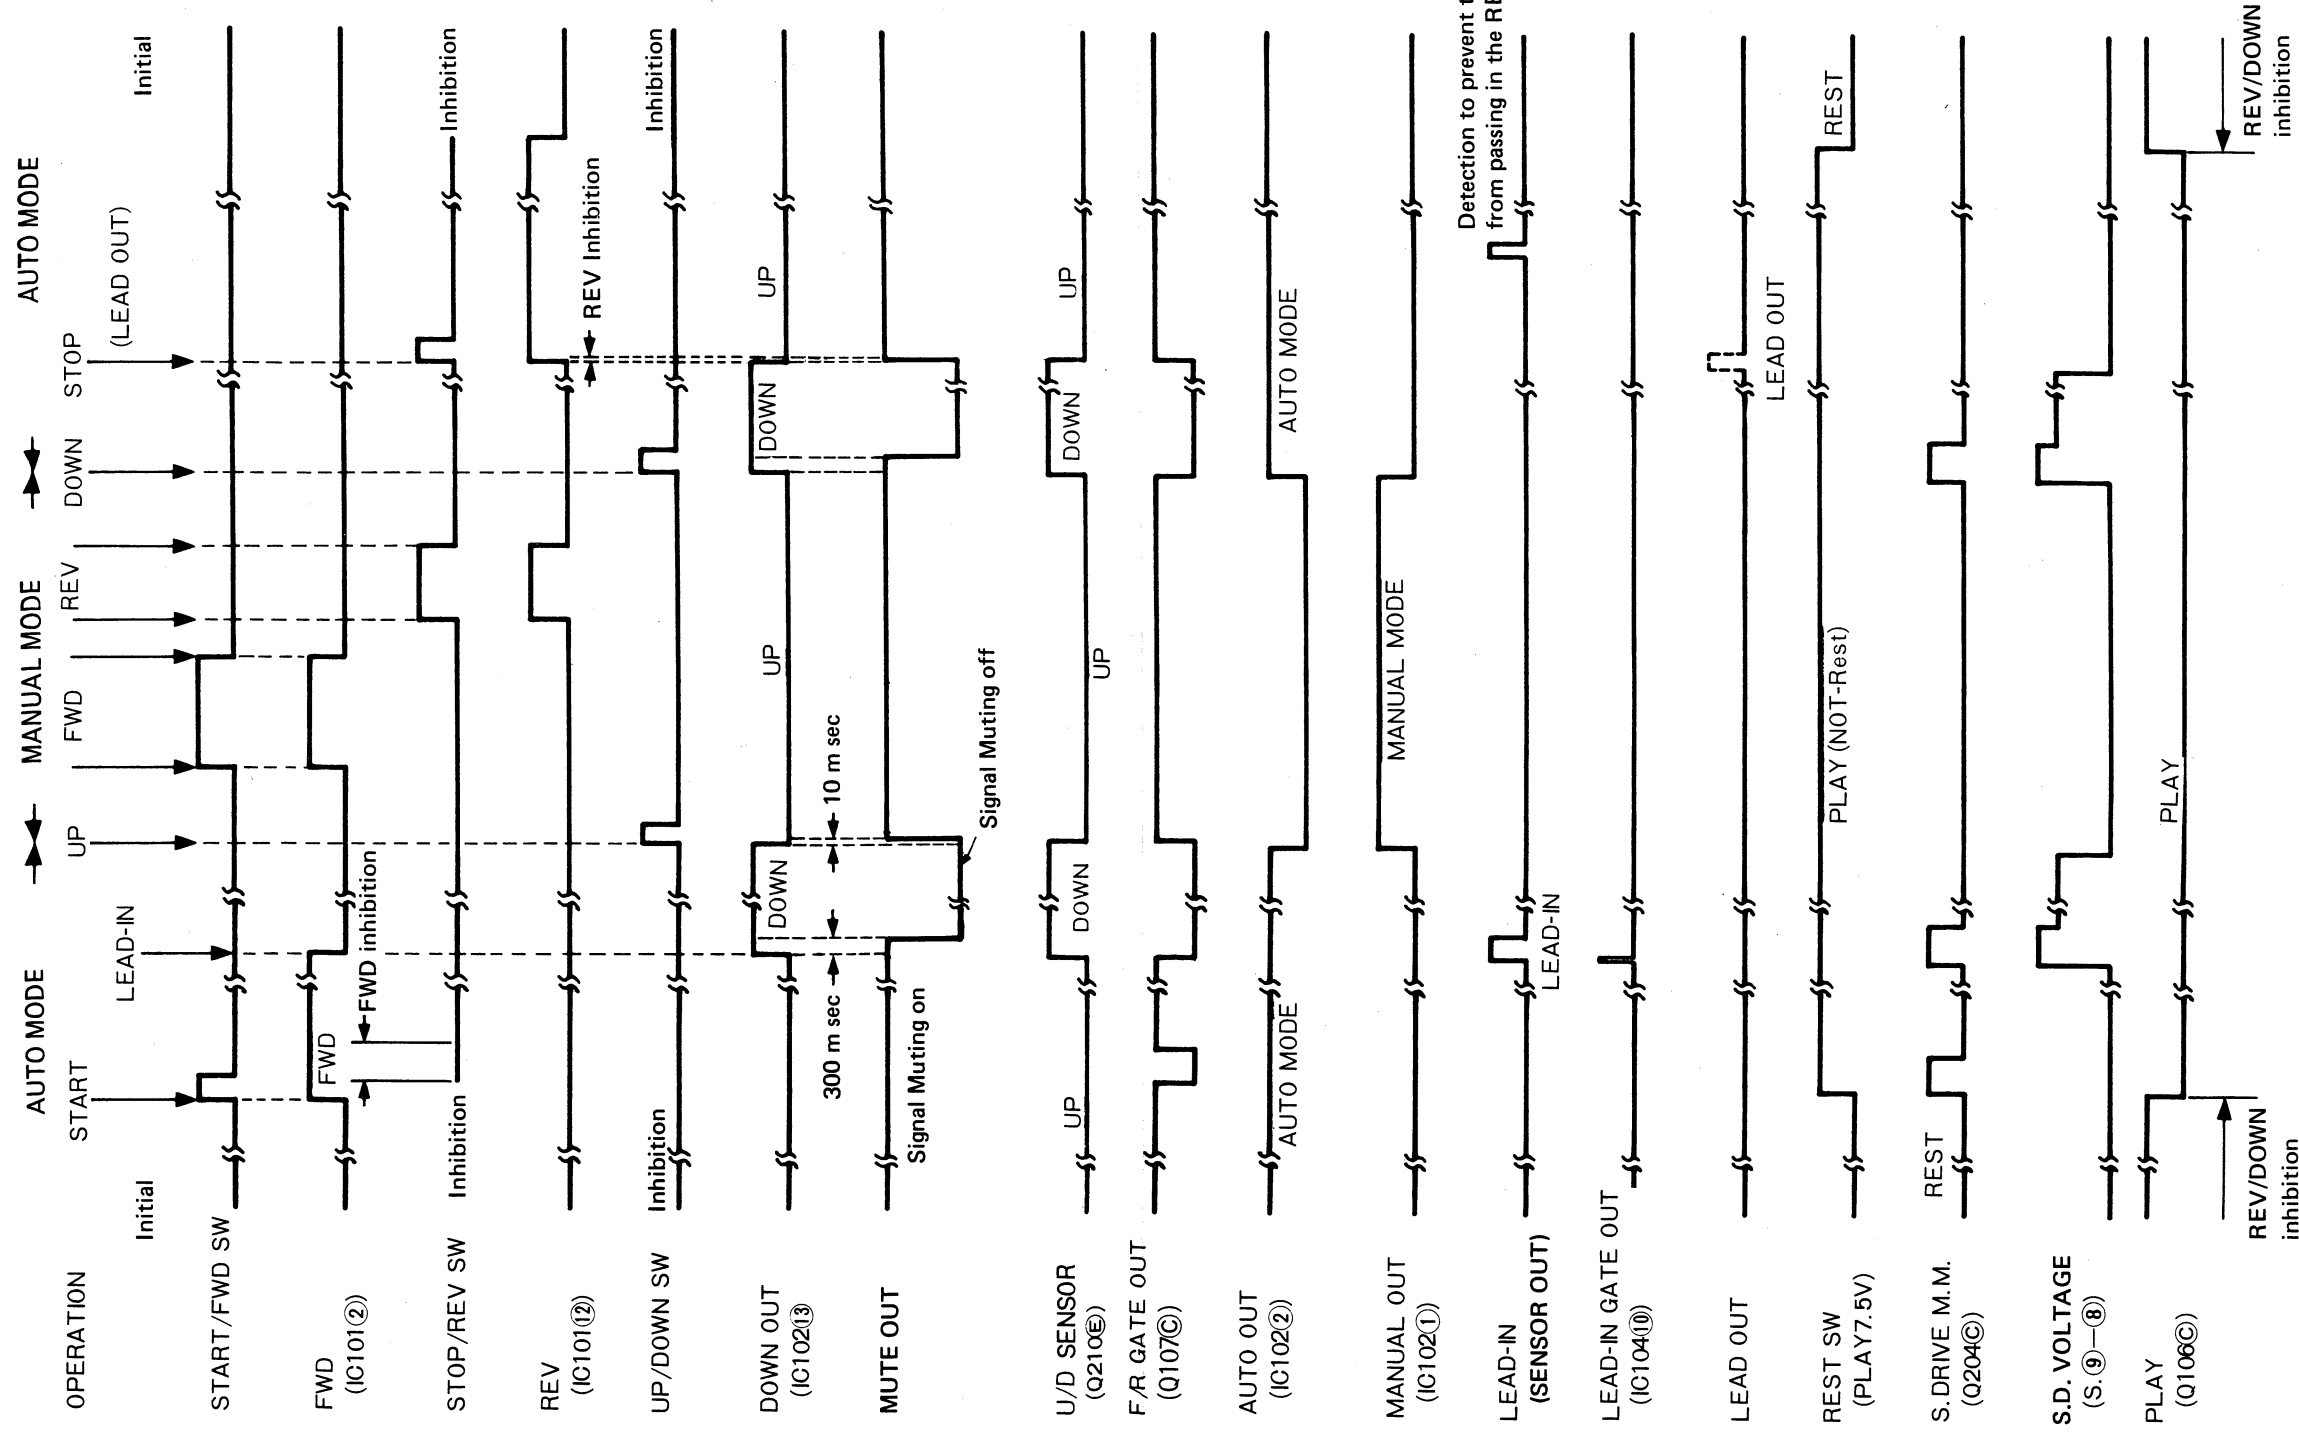

Fig. 16 Timing Chart

5-7-1 Start operation

- 1) At first, by signals INITIAL RESET and PLAY, the tonearm is lifted up to the rest position and the turntable is in the auto mode. At this time, since PLAY 7.5 V is not supplied to the STOP/REV switch, the operation of this switch is inhibited. Even when the UP/DOWN switch is pressed, the UP/DOWN latch is cleared with signal PLAY at "H", thus the DOWN operation is inhibited with the UP mode kept as it is. This is called the "initial mode."
- 2) When the START/FWD switch is pressed and soon released, the start operation begins because of the auto mode. First, the FWD latch is cleared with signal START SW OUT at "H", thus making signal FWD into "H". The REV latch is preset by pin 10 of IC105 (OR-A), thus making signal REV into "L". Subsequently, signal FWD OUT at "H" is emitted from pin 6 of FWD gate IC104 (AND-A). Thereby, the tonearm is forwarded.
- 3) When the tonearm is moved and released from the REST switch, the state of the solenoid drive monostable multivibrator is inverted at the rise time of PLAY 7.5 V by R201 and C201. Then, when Q107 (the control of the FWD and REV gates) is turned ON with the collector of Q204 at "H", the tonearm is stopped temporarily with signal FWD OUT at "L" (see 5-3. Solenoid Drive Circuit on page 11), after which the tonearm continues forwarding again. In addition, PLAY 7.5 V turns Q106 ON to

enter the play mode with signal PLAY at "L". The operation of the START/FWD and UP/DOWN switches is thereby released from inhibition. Therefore, especially with a 17 cm record, be careful in operating the UP/DOWN switch until the tonearm is led in.

(This is because the tonearm is lowered down outside of the record.)

- 4) When the lead-in position is detected subsequent to FWD action, signal LEAD-IN becomes "H", thus an "H" pulse is entered into pin 12 of IC104 (AND-C) with pin 3 of IC103 (OR-C) at "H". At this time, since any other input is "H" because of the auto and FWD modes, signal LEAD-IN GATE OUT of pin 10 of IC104 (AND-C) becomes "H". The leading edge of this signal becomes the clock pulse to the FWD and REV latches.

Since the data (D) inputs of the FWD and REV latches are "H", the tonearm is stopped with signals FWD and REV at "L". In addition, signal LEAD-IN GATE OUT becomes the clock pulse of the UP/DOWN latch through IC103 (OR-B). Therefore, the Q output (pin 13), signal DOWN OUT, of IC102 becomes "H" with the \bar{Q} output (pin 12) and data input (pin 9) of IC102 both at "H" in the UP mode.

The tonearm is thus lowered down.

Since the MANUAL/AUTO latch is cleared with signal DOWN OUT at "H", the turntable enters the auto mode.

5-7-2 UP operation

- 1) When the UP/DOWN switch is pressed during play, signal UP SW OUT at "H" becomes the clock pulse of the UP/DOWN latch through IC103 (OR-B). At this time, since signal DOWN OUT becomes "L" at the rise time of signal UP SW OUT with the \bar{Q} output (pin 12) and data input (pin 9) of IC102 both at "L", the tonearm is lifted up.
- 2) Since the "H" output of pin 10 of IC103 (OR-B) presets (PR) the MANUAL/AUTO latch through C120 and R166, signals AUTO OUT

(pin 2) and MANUAL OUT (pin 1) of IC102 becomes "L" and "H", respectively.

Thus, the turntable enters the manual mode.

- 3) Signal MANUAL OUT at "H" presets the FWD latch through IC103 (OR-A) to make signal FWD into "L".

Subsequently, signal MANUAL OUT presets the REV latch through IC105 (OR-A) to make signal REV into "L". Thereby, the FWD and REV operations are canceled.

5-7-3 FWD, REV and MANUAL operations

- 1) Any of these operations can be performed in the UP mode by the UP/DOWN switch. At first, when the FWD switch is pressed, the FWD latch is cleared and signal FWD becomes "H". Then the REV latch is preset and signal REV becomes "L".

At this time, since the tonearm is lifted up, it is forwarded with signal FWD OUT at "H" while the FWD switch is pressed. When the FWD switch is released, the FWD operation is canceled with signal MANUAL OUT at "H". In addition, while the REV switch is pressed, the tonearm is reversed.

- 2) When the lead-out position is detected during the FWD action, since the leading edge of signal LEAD OUT at "H" becomes the clock pulse of the MANUAL/AUTO latch, the turntable enters the auto mode with the data input (pin 5) of IC102 at "L".

Signal LEAD OUT at "H" becomes the stop

indication signal through D105. However, while the FWD switch is pressed, the FWD latch is cleared by signal FWD SW OUT and the REV latch by signal LEAD OUT. Subsequently, signals FWD and REV become "H". Since the inputs to the FWD and REV gates however become "L" at the respective \bar{Q} outputs of these latches, signals FWD OUT and REV OUT become "L". Thus, the tonearm stops at the lead-out position. When the FWD switch is released, the stop operation (described later) is performed. In addition, when the tonearm reaches the rest position in the REV operation, signal PLAY of the collector of Q106 becomes "H". The turntable thus enters the initial mode.

- 3) When the START/FWD and STOP/REV switches are both pressed without the tonearm at its rest, since the FWD, REV and UP/DOWN latches are all cleared, the tonearm is inhibited from moving in the UP mode.

5-7-4 DOWN operation

In this operation, when the UP/DOWN switch is pressed while the tonearm is slid or manually lifted up, the tonearm is lowered down. First, the leading edge of signal UP/DOWN SW OUT at "H" becomes the clock pulse of the UP/DOWN latch through IC103 (OR-B). Thus, signal DOWN OUT becomes "H" with the \bar{Q} output (pin 12) and data input (pin 9) of IC102 both at "H" when the tonearm is lifted up, thereby permitting the DOWN

operation. At the same time, Q107 turns ON to inhibit the FWD and REV operations.

At this time, the MANUAL/AUTO latch is preset to enter the auto mode. In addition, the DOWN operation is performed irrespective of the manual or auto mode when required. Therefore, be careful not to lower down the tonearm outside of the record in the start (auto FWD) or stop (auto REV) operation. If so, play is made again.

5-7-5 Stop (lead-out/auto REV) operation

- 1) During play, when the STOP/REV switch is pressed or when the lead-out position is detected, the FWD latch is preset by signal STOP SW OUT at "H" or signal LEAD-OUT at "H" through D105. Thus, signal FWD becomes "L" and the REV latch is cleared.

At this time, signal REV becomes "H" to clear the UP/DOWN latch to make signal DOWN OUT into "L".

- 2) Q107 (the control of the FWD and REV gates) is turned OFF when the tonearm is lifted up. Signal REV OUT at "H" is emitted from pin 9 of REV gate IC104 (AND-B), thus starting the REV operation.

- 3) During the REV action, even when the lead-in position is detected, the tonearm passes the lead-in position as it is, because lead-in gate IC104 (AND-C) remains "L". Subsequently, when the tonearm reaches its rest, signal PLAY at the collector of Q106 becomes "H". Thus, the REV operation is canceled to enter the initial mode.

- 4) During the REV action, when the DOWN switch is pressed, the tonearm stops and lowers down. (Refer to 5-7-4)

5-7-6 Manual (B) operation

When continuing pressing the START switch in the start operation, even when the lead-in position is detected, the FWD latch is cleared with signal START/FWD SW OUT at "H". At the same time,

the UP/DOWN latch in the FWD mode is also cleared through IC105 (OR-B). Thus, the turntable enters the manual mode.

5-7-7 Auto FWD operation

Since the turntable is in the auto mode during play, when the START/FWD switch is pressed and released, the tonearm is forwarded in the start operation with itself lifted up. When the DOWN switch is pressed as required, the turntable enters the play mode again (see item 5-7-4).

Therefore, unless the DOWN operation is indicated,

the tonearm automatically moves inwards as it is. When the lead-out position is detected, the stop (lead-out) operation is performed.

In addition, when the START/FWD switch is pressed at the lead-out position, the tonearm stops there.

When it is released, the tonearm returns to its rest.

Appendix

Specifications

Motor Section

Motor	: DC type, FG servomotor
Drive system	: Belt drive
Speeds	: 33-1/3 rpm, 45 rpm
Wow and flutter	: 0.08 % (DIN), 0.06 % (WRMS)
Signal-to-noise ratio	: More than 60 dB (DIN-B)

Tonearm Section

Type	: Linear tracking statically balanced low mass arm
Effective length	: 102 mm
Tracking error	: 0.3°

Cartridge Section

Model	: MD-1038L (USA, Canada only) MD-1041 (others)
Type	: Low mass type, dual magnet (USA, Canada only), induced magnet (others)
Frequency response	: 20 Hz – 20,000 Hz
Output	: 2.4 mV (1,000 Hz)
Channel separation	: 20 dB (1,000 Hz) (Test record TRS-1)
Load resistance	: 47 k Ω
Stylus tip	: 0.6 mil diamond
Stylus	: DT-38 (USA, Canada only), DT-41 (others)
Optimum tracking force	: 2.0 g (USA, Canada only), 2.5 g (others)

General

Power consumption	: 12 watts
Dimensions	: 8.7 cm (H) x 34 (or 34.4) cm (W) x 35 cm (D) (Since the dimensions are only the design figures, additional space will be required when installing the unit in a rack, etc.)
Weight	: 4.5 kg (10.0 lbs) (without corrugated cardboard case)
